ARCHITECTURAL  IMPORTANT INFORMATION

The application and detail drawings in this manual are strictly for illustration purposes and may not be applicable to all building designs or product installations. All projects should conform to applicable building codes for that particular area. It is recommended to follow all building regulations and standard industry practices.

Metal Sales Manufacturing Corporation is not responsible for the performance of the roof system if it is not installed in accordance with the suggested instructions referenced in this manual. If there is a conflict between this manual and the actual erection drawings, the erection drawings are to take precedence.

Prior to ordering and installing materials, all dimensions should be verified by field measurements.

Metal Sales reserves the right to modify, without notice, any details, recommendations or suggestions. Any questions you may have regarding proper installation of these Architectural roofing systems should be directed to your local Metal Sales representative, (see pages 2 and 3).

Oil canning is not a cause for rejection. Oil canning can be described as the amount of waviness found in the flat areas of metal panels. Oil canning is an inherent characteristic of light gauge cold formed metal products, particularly those with broad flat areas. There are many factors which may contribute to oil canning that Metal Sales is not able to control. These factors include: misalignment of the support system, over driving of fasteners used on the panels, stress (whether inherent in the panel or induced), thermal expansion and contraction of the panel, improper material handling, width, gauge, length, color of panels, and improper installation (reference Metal Construction Association "Oil Canning Position Paper"- Appendix A).

Consult your local Metal Sales Branch for any additional information not outlined in this manual.

This manual is designed to be utilized as a guide when installing an Architectural roofing system. It is the responsibility of the erector to ensure the safe installation of this product system.

SAFETY

STUDY APPLICABLE OSHA AND OTHER SAFETY REQUIREMENTS BEFORE FOLLOWING THESE INSTRUCTIONS.

The installation of metal roof systems is a dangerous procedure and should be supervised by trained knowledgeable erectors. USE EXTREME CARE WHILE INSTALLING ROOF PANELS. It is not possible for Metal Sales to be aware of all the possible job site situations that could cause an unsafe condition to exist. The erector of the roof system is responsible for reading these instructions and determining the safest way to install the roof system.

These instructions are provided only as a guide to show a knowledgeable, trained erector the correct parts placement one to another. If following any of the installation steps would endanger a worker, the erector should stop work and decide upon a corrective action.

Provide required safety railing, netting, or safety lines for crew members working on the roof.

Do not use the roof panel as a walking platform. The roof panels will not withstand the weight of a person standing at the edge of the panel.

Do not stand on the roof panel at the ends until the panels have been attached.
Metal Sales offers a complete line of metal roof, wall and fascia panel systems for the commercial, architectural, industrial, residential, and agricultural markets. Metal Sales offers over 75 profiles with a wide selection of widths, colors and gauges - new construction or retrofit.

NOTE: Shaded areas represent regions served by each location.

ARCHITECTURAL HANDLING MATERIAL

RECEIVING MATERIAL

It is the responsibility of the installer to unload material from the delivery truck. The installer shall be responsible for providing suitable equipment for unloading of material from the delivery.

After receiving material, check the condition of the material, and review the shipment against the shipping list to ensure all materials are accounted for. If damages or shortages are discovered, it should be noted on the Bill of Lading at the time of delivery. A claim should be made against the carrier as soon as possible. (Metal Sales is not responsible for any damages or shortages unless they are documented in writing and presented to Metal Sales within 48 hours.)

GENERAL HANDLING

Each bundle should be handled carefully to avoid being damaged. Care should be taken to prevent bending of the panel or abrasion to finish. Whenever possible, the bundle should remain crated until it is located in its place of storage. If bundles must be opened, we recommend you recreate them before lifting. To avoid damage please lift the bundle at its center of gravity.

CAUTION

Improper loading and unloading of bundles and crates may result in bodily harm and/or material damage. Metal Sales is not responsible for bodily injuries and/or material damages resulting from improper loading and unloading.

MECHANICAL HANDLING

Forklift - A forklift may be used for panels up to 20'-0" long. Please make sure the forks are at their maximum separation. Do not transport open bundles. When transporting bundles across rough terrain, or over a longer distance, some means of supporting the panel load must be used.

Crane - A crane should be used when lifting panels with lengths greater than 20'-0". Please be sure to utilize a spreader bar to ensure the even distribution of the weight to the pick up points. As a rule when lifting panels, no more than \( \frac{1}{3} \) of the length of the panel should be left unsupported. Never use wire rope because this will damage the panels.
When handling painted steel care should be taken to prevent scratching of material. Clean gloves should be worn at all times to prevent a reaction with salts found on bare skin. Installers should wear rubber sole shoes to keep from scuffing material while walking on the roof.

Handling of individual panels should be done carefully and properly to avoid bending or damaging. Architectural panels should be carried by grasping the edge of the panel so that the Architectural panel is vertical to the ground. The Architectural panel should not be carried with the panel horizontal to the ground as this could cause the panel to buckle or bend in the center.

Normally, individual panels can be handled by people placed every 6'-0" to 8'-0" along the length of the panel.
GENERAL

Please inspect panels for moisture accumulation. If moisture has formed, the panels should be unbundled, wiped dry, and allowed to dry completely. Once dry, carefully re-stack the panels and loosely recover allowing for ample air circulation.

Bundled sheets should be stored high enough off of the ground to allow for air circulation and prevent contact with accumulating water. Elevate one end of the bundle to allow any moisture to run off the panels. Metal Sales recommends covering the bundle with a tarp. Do not use tight fitting plastic-type tarps as panel bundle covers. While they may provide protection from heavy downpours, they can also retard necessary ventilation and trap heat and moisture that may accelerate metal corrosion. If panels are to be stored in possible bad weather, we suggest they be stored inside. Extended storage of panels in a bundle is not recommended. Under no circumstances should the sheets be stored near or come in contact with salt water, corrosive chemicals, ash, or fumes generated or released inside the building or nearby plants, foundries, plating works, kilns, fertilizer and wet or green lumber.
To facilitate the handling of Architectural panels, panel bundles can be lifted and placed on the roof. Bundles need to be placed on the roof in order for the roof structure to handle the weight. Loading capabilities of the structure must be checked.

When lifting packaged sheets, make certain they are adequately supported. Panels less than 20'-0" in length can normally be lifted with a forklift; however, when lifting panels in excess of 20'-0", it is recommended that a spreader bar and slings be used. As a rule, when lifting, no more than 1/3 of the length of the panel should be left unsupported.

Make a plan for bundle placement by determining how much area a bundle of panels will cover. Bundles should be placed on the roof in accordance with the direction the panel will be installed. Consider where the string line, if any, is to run at the eave to set roof panels by. Roof bundles should not interfere with this string line.
Care of Architectural metal panels and flashings must be exercised throughout erection. Foot traffic can cause distortion of panel and damage to finish. Traffic over the installed system must be kept to an absolute minimum. If continuous foot traffic is necessary for maintenance over certain areas of the roof, then a permanent walkway should be installed.

If continuous foot traffic is necessary during installation, provide walking platforms to avoid any panel damage as shown below. When walking on the roof panels is unavoidable, walk only in the flats of the panel. Walking on the ribs can cause damage to the panels.
FIELD CUTTING

Tin snips or a "nibbler" type electric tool are recommended for field cutting Architectural panels. Cutting the steel generates slivers or metal chips. These slivers and metal chips must be immediately removed from the Architectural panels because they will damage the finish and shorten the life of the product.

One method of preventing this problem is to flip the panels over when cutting. This allows the slivers and metal chips to be brushed from the back side and avoids damaging the paint on the top side of the panels.

When cutting metal panels, goggles must be worn for eye protection.

CAUTION

All product surfaces should be free of debris at all times. Installed surfaces should be wiped clean at the end of each work period. Never cut panels over metal surfaces. Metal shavings will rust on the surface, voiding the warranty.

TOUCH-UP PAINT

All painted panels and flashings have a factory applied baked on finish. Handling and installing panels may result in some small scratches or nicks to the paint finish. Touch-up paint is available in matching colors from Metal Sales. It is recommended that a small brush be used to apply touch-up paint to those areas that are in need of repair. Touch-up paint does not have the superior chalk and fade resistance of the factory applied paint finish and will normally discolor at an accelerated rate. Aerosol paint should not be used because of the overspray that may occur.

**FASTENER INSTALLATION TECHNIQUE**

**Recommended Tool Type** - Use depth locating nose or adjustable clutch on screw gun to prevent over-drilling and strip out.

Do not use impact tools or runners.

**Seating the washer** - Apply sufficient torque to seat the washer - do not overdrive the fastener.

<table>
<thead>
<tr>
<th>CORRECT</th>
<th>TOO LOOSE</th>
<th>TOO TIGHT</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sealing material slightly visible at edge of metal washer. Assembly is watertight.</td>
<td>Sealing material is not visible; not enough compression to seal properly.</td>
<td>Metal washer deformed; sealing material pressed beyond washer edge.</td>
</tr>
</tbody>
</table>

**To prevent wobbling** - Make sure fastener head is completely engaged in the socket. If the head does not go all the way in the socket - tap the magnet deeper into the socket to allow full head engagement. Metal chips will build up from drilling and should be removed from time to time.

**Protect drill point** - Push only hard enough on the screw gun to engage clutch. This prevents excess friction and burn out of the drill point. Correct pressure will allow screw to drill and tap without binding.

**Drilling through sheet and insulation** - Ease up on pressure when drilling through insulation to avoid striking the purlin or girt with the point - apply more pressure after drill point contacts purlin or girt.

**Drilling through purlin overlaps** - Drilling through lapped purlins requires extra care. Excessive voids between purlins sometimes damages drill points and two self-drillers might be necessary to complete the operation. It is sometimes advantageous to pre-drill.
When installing over solid substrate, panel distortion may occur if not applied over properly aligned and uniform substructure.

The installer should check the roof deck for squareness before installing Architectural panels. Several methods can be used to verify squareness of the structure for proper installation of the panels.

**METHOD "A"** - One method for checking the roof for squareness is to measure diagonally across one slope of the roof from similar points at the ridge and eave and obtain the same dimension.

**METHOD "B"** - The 3-4-5 triangle system may also be used. To use this system measure a point from the corner along the edge of the roof at a module of three (3). Measure a point from the same corner along another edge at a module of four (4). Then by measuring diagonally between the two points established, the dimension should be exactly a module of five (5) to have a square corner. Multiple uses of this system may be required to determine building squareness. If the endwall cannot be made square, the roof system cannot be installed as shown in these instructions.

---

**CONDITION OF SUBSTRUCTURE**

Proper design and installation of vapor barriers and ventilation systems are important to prevent condensation and the resulting problems of moisture damage and loss of insulation efficiency.

Condensation occurs when moisture laden air comes in contact with a surface temperature equal to or below the dew point of the air. This phenomenon creates problems that are not unique with metal roofing; these problems are common to all types of construction.

The underside of the metal roof on a typical Architectural building should be protected from condensation by installing panels directly over a minimum 30 lb moisture barrier and uniform solid substrate. This reduces airspace and the potential of condensation forming on the underside of the panels.

---

**VENTILATION**

Proper design and installation of vapor barriers and ventilation systems are important to prevent condensation and the resulting problems of moisture damage and loss of insulation efficiency.

Condensation occurs when moisture laden air comes in contact with a surface temperature equal to or below the dew point of the air. This phenomenon creates problems that are not unique with metal roofing; these problems are common to all types of construction.

The underside of the metal roof on a typical Architectural building should be protected from condensation by installing panels directly over a minimum 30 lb moisture barrier and uniform solid substrate. This reduces airspace and the potential of condensation forming on the underside of the panels.
The following chart highlights UL 580 Class 90 for clip installation on the selected applications. (See Fastener Selection Guide page 20 for other fasteners available.) For more information on UL Construction numbers, refer to UL Roofing Materials and System Directories. Panel gauges and clip spacing should be determined by a professional engineer according to the governing building code.

</table>

* Length of Deck Screw will vary depending on the total thickness of the rigid insulation and metal decking. (See page 20.)
** Contact your local Metal Sales branch representative for more information. (See pages 2 and 3.)
1. For 1” Mini-Batten over 5/8” plywood deck only.
2. Subject to project loading, closer fastener spacing may be required.
3. Maxi-Batten Cap from Fontana, CA branch only meets UL Construction Numbers shown.
**ARCHITECTURAL MINI-BATTEN INSTALLATION**

**INSTALLING FIRST PANEL**

Note: Moisture Barriers, Eave, Gutter, Valley and Offset Cleat flashings must first be installed before panel installation can begin (see pages 33-36).

Mini-Batten panels are installed from left to right or right to left.

1. Field notch and hem the Mini-Batten panel as shown on page 56. Apply a single bead of tube sealant inside the open hem of the Mini-Batten panel.

2. Install first panel so that eave has proper overhang making sure that panel is square to eave and rake. Slide the panel toward the peak of the roof engaging the panel and the Offset Cleat. Offset Cleat must be fully engaged into the panel. Additional overhang must be considered if using wall panels.

   It is critical that the first panel be straight and square with the building as it controls alignment of the following roof panels.

**INSTALLING CLIPS**

1. Once the first panel has been installed, engage clips at proper spacing along the male leg and fasten with appropriate fastener. Fastener spacing must be designed to meet local building codes (see page 23). If a fastener strips out, you must remove the clip and reposition it so the fastener can drill a new hole at least 3/8" from the stripped hole or install an oversized fastener in the stripped hole. Failure to do so will result in weakening the wind uplift resistance.
**INSTALLING SECOND PANEL**

1. Field notch and hem the Mini-Batten panel as shown on page 56. Apply a single bead of tube sealant inside the open hem of the Mini-Batten panel.
2. Install second panel so that eave has proper overhang making sure that panel is square to eave and rake. Slide the panel toward the peak of the roof engaging the panel and the Offset Cleat. Offset Cleat must be fully engaged into the panel. Additional overhang must be considered if using wall panels. Make sure all panels are properly snapped in place.
3. Continue with previous steps until panel installation is complete.

**INSTALLING BATTEN CAP**

1. Tabs on Mini-Batten Clip must be field bent down to accept Mini-Batten Cap. Bend tabs over vertical leg of the panel.
2. Install Mini-Batten Cap over the panel rib and Mini-Batten Clip. Snap the Mini-Batten Cap into place working from one end to the other.
3. Once installation is complete, fill each end of batten with proper sealant (see page 28), and clean any debris and excess sealant from the panels.
4. Attach every Batten Cap to the panel or flashing, near the high end of the Batten Cap, with a Pop Rivet as shown below.
JUnit: Moisture Barriers, Eave, Gutter, Valley and Offset Cleat flashings must first be installed before panel installation can begin (see pages 33-36).

Maxi-Batten panels are installed from left to right or right to left.

1. Field notch and hem the Maxi-Batten panel as shown on page 56. Apply a single bead of tube sealant inside the open hem of the Maxi-Batten panel.

2. Install first panel so that eave has proper overhang making sure that panel is square to eave and rake. Slide the panel toward the peak of the roof engaging the panel and the Offset Cleat. Offset Cleat must be fully engaged into the panel. Additional overhang must be considered if using wall panels. It is critical that the first panel be straight and square with the building as it controls alignment of the following roof panels.

**STEP 1**

**INSTALLING FIRST PANEL**

Square panel to rake condition

Properly position panel for eave condition

**STEP 2**

**INSTALLING SECOND PANEL**

1. Install second panel in place making sure panel is positioned with adequate space to allow for placement of Maxi-Batten Clip. Make sure panel ends at eave are aligned.
**INSTALLING CLIPS**

**STEP 3**

1. Engage clips at proper spacing along the male legs and fasten with appropriate fastener to meet local building codes (see page 25). If a fastener strips out, you must remove the clip and reposition it so the fastener can drill a new hole at least 1/8” from the stripped hole or install an oversized fastener in the stripped hole. Failure to do so will result in weakening the wind uplift resistance.
2. Continue with previous steps until panel installation is complete.

**INSTALLING BATTEN CAP**

**STEP 4**

1. Install Maxi-Batten Cap over the panel rib and Maxi-Batten Clip. Snap Maxi-Batten Cap into place working from one end to the other. Make sure all batten caps are properly snapped in place. Clean any debris and excess sealant from the panels.
2. Once installation is complete, close open end of panel with either field fabricated piece or order Batten Cap 1” longer (see detail on page 28).
3. Attach every Batten Cap to the flashing, near the high end of the Batten Cap, with a Pop Rivet as shown below.

ARCHITECTURAL IMAGE II INSTALLATION (EXPOSED FASTENED END)

**INSTALLING FIRST PANEL**

**STEP 1**

1. Apply a row of Double Bead Tape Sealant on the top leg of the Eave Flashing.
2. Install first panel so that the panel end has proper overhang (refer to pages 33-36) making sure that panel is square to eave and rake. **It is critical that the first panel be straight and square with the building as it controls alignment of the following roof panels.**
3. Fasten panel to substrate with (1) #10-12 x 1" Pancake Head Woodscrew in center of the fastening groove located along the male leg of the panel. Fastener spacing must be designed to meet local building codes (see page 23). **It is important that the fastener be placed in the center of the fastening groove and make sure not to over tighten screws.**
4. Fasten Image II panel with (4) #10-14 x 1" Woodscrews through Double Bead Tape Sealant, flashing, and into the solid substrate as shown below.

1. Snap second panel in place making sure panel ends are aligned. Snap panel in place working from one end to the other.
2. Fasten Image II panel with (4) #10-14 x 1" Woodscrews through Double Bead Tape Sealant, flashing and into the solid substrate as shown below.
3. Continue with previous step until installation is complete.
4. Fasten panel to substrate with (1) #10-12 x 1" Pancake Head Woodscrew in center of the fastening groove located along the male leg of the panel. Fastener spacing must be designed to meet local building codes (see page 23). **It is important that the fastener be placed in the center of the fastening groove and make sure not to over tighten screws.**
5. Once installation is complete, fill each lower end of panel rib with Tube Sealant and clean any debris and excess sealant before continuing next area.

**CAUTION**

Additional screws may be required for high snow loading and steep slopes.

**INSTALLING SECOND PANEL**

**STEP 2**

1. Snap second panel in place making sure panel ends are aligned. Snap panel in place working from one end to the other.
2. Fasten Image II panel with (4) #10-14 x 1" Woodscrews through Double Bead Tape Sealant, flashing and into the solid substrate as shown below.
3. Continue with previous step until installation is complete.
4. Fasten panel to substrate with (1) #10-12 x 1" Pancake Head Woodscrew in center of the fastening groove located along the male leg of the panel. Fastener spacing must be designed to meet local building codes (see page 23). **It is important that the fastener be placed in the center of the fastening groove and make sure not to over tighten screws.**
5. Once installation is complete, fill each lower end of panel rib with Tube Sealant and clean any debris and excess sealant before continuing next area.

**CAUTION**

Additional screws may be required for high snow loading and steep slopes.
1. Field notch and hem the Image II panel as shown on page 55. Apply a single bead of Tube Sealant inside the open hem of the Image II panel.
2. Install first panel so that eave has proper overhang making sure that panel is square to eave and rake. Slide the panel toward the peak of the roof engaging the panel and the Offset Cleat. Offset Cleat must be fully engaged into the panel. Additional overhang must be considered if using wall panels. **It is critical that the first panel be straight and square with the building as it controls alignment of the following roof panels.**
3. Fasten panel to substrate with (1) #10-12 x 1" Pancake Head Woodscrew in **center** of the fastening groove located along the male leg of the panel. Fastener spacing must be designed to meet local building codes (see page 23). **It is important that the fastener be placed in the center of the fastening groove and make sure not to over tighten screws.**

**Note:** Moisture Barriers, Eave, Gutter, Valley and Offset Cleat flashings must first be installed before panel installation can begin.

**Image II panels are installed from left to right or right to left.**

1. Field notch and hem the Image II panel as shown on page 55. Apply a single bead of Tube Sealant inside the open hem of the Image II panel.
2. Install second panel so that eave has proper overhang making sure that panel is square to eave and rake. Slide the panel toward the peak of the roof engaging the panel and the Offset Cleat. Offset Cleat must be fully engaged into the panel. Additional overhang must be considered if using wall panels.
3. Place the second panel on top of previously installed panel so that the second hemmed panel can be engaged with the Offset Cleat.
4. Begin snapping the panels together working from eave to peak. **It is critical that panels only be snapped in one direction.**
5. Repeat steps 3 and 4 for remaining panels.
6. Once installation is complete, fill each lower end of panel rib with sealant. Also, clean any debris and excess sealant before continuing next area. Panels may also be field notched and bent to close off panel end (see page 55).
Note: Moisture Barriers and Jamb flashings must first be installed before panel installation can begin (see pages 50-54). Soffit panels are installed from left to right or right to left (see page 32).

1. Install first panel making sure that panel is square to the soffit, fascia, or wall. **It is critical that the first panel be straight and square with the building as it controls alignment of the following panels.** Fasten panel typically with pancake head woodscrews (12" o.c. typical) in center of the fastening groove and make sure not to overtighten screws. For areas with high wind considerations, closer fastener spacing may be required. Testing indicates that an adhesive in the sidelap is needed to prevent panel disengagement.

   ![Diagram of installing first panel]

   - Square panel to soffit, fascia or wall
   - Fasten in center of groove with pancake head fasteners (see installed panel cross section on page 32)

### INSTALLING SECOND PANEL

1. Position tongue of second panel into the groove of the first, making sure panel ends are aligned and continue with previous steps until installation is complete. Make sure all panels are properly installed, and clean any debris from panel before continuing to next area.

   ![Diagram of installing second panel]

   - Square panel to soffit, fascia or wall
   - Second Soffit Panel positioned into place
Soffit Panel can be installed in either direction.
3:12 Slope Minimum

Panel rib must be field notched and flat part of panel must be field bent to accept Offset Cleat (see pages 55 and 56).

**INSTALLATION NOTES**

All Eave flashings must be installed prior to panel installation.

1. Position and install Cleat to wall with appropriate fastener, 12" o.c. Make sure Cleat allows for proper Eave attachment.
2. Install Eave flashing by sliding open hem onto Cleat and resting the Eave flashing against the substrate and fasten with #10-12 x 1" Pancake Head Woodscrew (4'-0" o.c.) to hold the Eave Flashing in place during installation.
3. Apply a row of Double Bead Tape Sealant on the bottom leg of the Offset Cleat and fasten to substrate with #10-12 x 1" Pancake Head Woodscrew through top of Eave flashing and into substrate, 12" o.c. Make sure Offset Cleat is lined up to properly accommodate hemmed panel.
4. Install panel by engaging field-hemmed end of panel (see pages 55 and 56) to Offset Cleat (See pages 24-30 for panel installation).
5. If two or more flashings are required, lap the flashing over the previously installed flashing by a minimum of 2" placing a bead of Tube Sealant between the flashings and securing with Pop Rivets 2.5" o.c.
All Eave flashings must be installed prior to panel installation.

1. Position and install Cleat to wall with appropriate fastener, 12" o.c. Make sure Cleat allows for proper Extended Eave attachment.

2. Install Extended Eave flashing by sliding open hem onto Cleat and resting Extended Eave Flashing back against substrate. Fasten to substrate with #10-12 x 1" Pancake Head Woodscrew, 12"o.c.

3. Apply a row of Double Bead of Tape Sealant to extended leg of the Extended Eave flashing.

4. Install panel by engaging field hemmed-end of panel (see pages 55 and 56) to Extended Eave (see pages 24-30 for panel installation).

5. If two or more flashings are required, lap the flashing over the previously installed flashing by a minimum of 2" placing a bead of Tube Sealant between the flashings and securing with Pop Rivets 2.5" o.c.
All Gutter Flashings must be installed prior to panel installation.
1. Install Box Gutter flashing back against substrate. To hold Box Gutter flashing in place, fasten to substrate with #10-12 x 1" Pancake Head Wood Screw 4'-0" o.c.
2. Install Universal Gutter/Downspout Straps every 3'-0" of gutter length to substrate with #10-12 x 1" Pancake Head Wood Screw, and fasten to Box Gutter with (1) Pop Rivet per Strap.
3. Apply a row of Double Bead of Tape Sealant to bottom leg of Offset Cleat, position on back leg of Box Gutter, and fasten to substrate with #10-12 x 1" Pancake Head Wood Screw, 12" o.c.
4. Install panel by engaging field-hemmed end of panel (see pages 55 and 56) to Offset Cleat (see pages 24-30 for panel installation).
5. If two or more flashings are required, lap the flashing over the previously installed flashing by a minimum of 2" placing a bead of Tube Sealant between the flashings and securing with Pop Rivets 2.5" o.c.
6. Note: Size and gauge of box gutter must be designed to applicable governing building code.

© Metal Sales Manufacturing Corporation / Subject to change without notice, effective 4/17.
**ARCHITECTURAL VALLEY WITH OFFSET CLEAT DETAIL**

### INSTALLATION NOTES

All Valley flashings must be installed prior to panel installation. If two or more valley flashings are required, valley must be installed working from eave to peak. It is recommended that ms-HT be installed under valley flashing for added moisture protection.

1. Install Valley flashing against substrate. To hold Valley flashing in place, fasten to substrate with #10-12x1" Pancake Head fastener 4'-0" o.c.
2. Apply a row of Double Bead Tape Sealant across both sides of Valley flashing approximately 5" from center of valley.
3. Properly align and install Offset Cleat on both sides of Valley flashing to accommodate panel hem and fasten to substrate with #10-12x1" Pancake Head fastener 12" o.c.
4. Install panel by engaging field-hemmed end of panel (see pages 55 and 56) to Offset Cleat (see pages 24-30 for panel installation).
5. If two or more flashings are required, lap the flashing over the previously installed flashing by a minimum of 2", placing a bead of Tube Sealant between the flashings and securing with (2) Pop Rivets in the 1" water diverter.

---

Panel rib must be field notched and flat part of panel must be field bent to accept Offset Cleat (see pages 55 and 56).
3:12 Slope Minimum

1. If panel ends off module bend flat part of the panel up a minimum of 1”, otherwise skip to the next note.
2. Apply a row of Double Bead of Tape Sealant to the flat part of the panel next to the panel rib or vertical, field-bent leg.
3. Position Z-Closure over tape sealant and fasten to wood substrate with #10-12 x 1” Pancake Head Woodscrew, 12” o.c. Fastener must penetrate through the Z-Closure, Tape Sealant and panel.
4. Position and install Cleat to wall with appropriate fastener, 12” o.c. Make sure Cleat installation allows for proper Rake attachment.
5. Apply a row of Double Bead Tape Sealant to top leg of the Z-Closure.
6. Install Rake by sliding the open hem onto the Cleat and then attaching to the Z-Closure with ½"x⅛" Pop Rivets at 12” o.c.
7. If two or more flashings are required, lap the flashing over the previously installed flashing by a minimum of 2” placing a bead of Tube Sealant between the flashings and securing with Pop Rivets 2.5” o.c.
3:12 Slope
Minimum

INSTALLATION NOTES

1. If panel ends off module bend flat part of the panel up a minimum of 1”, otherwise skip to the next note.
2. Apply a row of Double Bead of Tape Sealant to the flat part of the panel next to the panel rib or vertical, field-bent leg.
3. Position Z-Closure over tape sealant and fasten to wood substrate with #10-12 x 1” Pancake Head Wood screw, 12” o.c. Fastener must penetrate through the Z-Closure, Tape Sealant and panel.
4. Install Rakewall to the Floating Z-Closure with 1/8” x 3/16” Pop Rivets at 12” o.c.
5. Install Counter Flashing, and fasten to parapet wall with appropriate fastener 12” o.c. Seal Counter Flashing to parapet wall with Tube Sealant.
6. If two or more flashings are required, lap the flashing over the previously installed flashing by a minimum of 2” placing a bead of Tube Sealant between the flashings and securing with Pop Rivets 2.5” o.c.
1. If panel ends off module bend flat part of the panel up a minimum of 1", otherwise skip to the next note.
2. Apply a row of Double Bead of Tape Sealant to the flat part of the panel next to the panel rib or vertical, field-bent leg.
3. Position Z-Closure over tape sealant and fasten to wood substrate with #10-12 x 1" Pancake Head Woodscrew, 12" o.c. Fastener must penetrate through the Z-Closure, Tape Sealant and panel.
4. Install Rakewall to the Floating Z-Closure with 1/8" x 3/16" Pop Rivets at 12" o.c.
5. Install Reglet in field-cut groove in the parapet wall. Seal Reglet to parapet wall with Tube Sealant.
6. If two or more flashings are required, lap the flashing over the previously installed flashing by a minimum of 2" placing a bead of Tube Sealant between the flashings and securing with Pop Rivets 2.5" o.c.
1. Once panels have been installed, field cut the Architectural Z-Closure (See page 57) to fit between the panel ribs.
2. Place a row of Double Bead Tape Sealant across panel and over each panel rib approximately 2" from panel end. Before proceeding make sure Z-Closure placement will accommodate 11" Ridge/Hip cover.
3. Install field-cut Z-Closure as shown on page 57.
4. Fasten Z-Closure through panel with #10-12 x 1" Pancake Head Woodscrews (4 per panel).
5. Apply a row of Double Bead Tape Sealant across top leg of Z-Closure filling any gaps or openings around panel ribs.
6. Position and install 11" Ridge/Hip Cover flashing to Z-Closure with 1/8" x 3/16" Pop Rivets (as shown).
7. If two or more flashings are required, lap the flashing over the previously installed flashing by a minimum of 2" placing a bead of Tube Sealant between the flashings and securing with Pop Rivets 2.5" o.c.

CAUTION
Additional screws may be required for high snow loading and steep slopes.

NOTE
For Mini/Maxi Batten Panels, Pop Rivet must attach Ridge/Hip Cover to each Batten Cap.

(Optional)
1. Once panels have been installed, field cut the Architectural Z-Closure (See page 57) to fit between the panel ribs.
2. Place a row of Double Bead Tape Sealant across panel and over each panel rib approximately 2" from panel end. Before proceeding, make sure Z-Closure placement will accommodate Vented Ridge cover.
3. Install field-cut Z-Closure as shown on page 57.
4. Fasten Z-Closure through panel with #10-12 x 1" Pancake Head Woodscrews (4 per panel).
5. Apply a row of Double Bead Tape Sealant across top leg of Z-Closure filling any gaps or openings around panel ribs.
6. Install Vent Drip, Vent Material, and Offset Cleat, as shown above with #14-13 x 2" deck screws, 12" o.c. and apply a row of Double Bead Tape Sealant to the top leg of the Offset Cleat.
7. Install Vented Ridge Cover to Offset Cleat with 1/8" x 3/16" Pop Rivets at 12" o.c.
8. If two or more flashings are required, lap the flashing over the previously installed flashing by a minimum of 2" placing a bead of Tube Sealant between the flashings and securing with Pop Rivets 2.5" o.c.
1. Once panels have been installed, field cut the Architectural Z-Closure (See page 57) to fit between the panel ribs.
2. Place a row of Double Bead Tape Sealant across panel and over each panel rib approximately 2" from panel end. Before proceeding make sure Z-Closure placement will accommodate Peak cover.
3. Install field-cut Z-Closure as shown on page 57.
4. Fasten Z-Closure through panel with #10-12 x 1" Pancake Head Woodscrews (4 per panel).
5. Apply a row of Double Bead Tape Sealant across top leg of Z-Closure filling any gaps or openings around panel ribs.
6. Position and install Cleat to the wall with the appropriate fastener, 12" o.c. Make sure cleat allows for proper Peak attachment.
7. Install Peak flashing by sliding the open hem onto the Cleat and then attaching to the Z-Closure with 1/8" x 3/16" Pop Rivets, at the spacing shown above.
8. If two or more flashings are required, lap the flashing over the previously installed flashing by a minimum of 2" placing a bead of Tube Sealant between the flashings and securing with Pop Rivets 2.5" o.c.
1. Once panels have been installed, field cut the Architectural Z-Closure (See page 57) to fit between the panel ribs.
2. Place a row of Double Bead Tape Sealant across panel and over each panel rib approximately 2” from panel end. Before proceeding make sure Z-Closure placement will accommodate Pitch Break flashing.
3. Install field-cut Z-Closure as shown on page 57.
4. Fasten Z-Closure through panel with #10-12 x 1” Pancake Head Woodscrews (4 per panel).
5. Apply a continuous bead of Tube Sealant across top leg of Z-Closure filling any gaps or openings around panel ribs. Position and install Pitch Break flashing to Z-Closure with 1/8” x 3/16” Pop Rivets (as shown).
6. Fasten vertical leg of Pitch Break to the parapet wall with the appropriate fastener (1'-0" o.c.).
7. Install Counter Flashing, and fasten to parapet wall with appropriate fastener 12” o.c. Seal Counter Flashing to parapet wall with Tube Sealant.
8. If two or more flashings are required, lap the flashing over the previously installed flashing by a minimum of 2” placing a bead of Tube Sealant between the flashings and securing with Pop Rivets 2.5” o.c.
1. Once panels have been installed, field cut the Architectural Z-Closure (See page 57) to fit between the panel ribs.
2. Place a row of Double Bead Tape Sealant across panel and over each panel rib approximately 2" from panel end. Before proceeding make sure Z-Closure placement will accommodate Pitch Break flashing.
3. Install field-cut Z-Closure as shown on page 57.
4. Fasten Z-Closure through panel with #10-12 x 1" Pancake Head Woodscrews (4 per panel).
5. Apply a continuous bead of Tube Sealant across top leg of Z-Closure filling any gaps or openings around panel ribs. Position and install Pitch Break flashing to Z-Closure with 1/8" x 1/16" Pop Rivets (as shown).
6. Fasten vertical leg of Pitch Break to the parapet wall with the appropriate fastener (1'-0" o.c.).
7. Install Reglet in field-cut groove in the parapet wall. Seal Reglet to parapet wall with Tube Sealant.
8. If two or more flashings are required, lap the flashing over the previously installed flashing by a minimum of 2" placing a bead of Tube Sealant between the flashings and securing with Pop Rivets 2.5" o.c.
**ARCHITECTURAL SLOPE CHANGE DETAILS**

**SLOPE CHANGE**

3:12 Slope Minimum

- Roof Panel
- Pancake Head Woodscrew (1'-0" o.c.)
- Offset Cleat
- Tube Sealant
- Moisture Barrier (By others)
- Pitch Break
- Pancake Head Woodscrew (1'-0" o.c.)
- Tube Sealant
- Double Bead Tape Sealant
- Pop Rivet (2 per panel and see note below)
- Z-Closure (See page 57)
- Roof Panel

**NOTE**
For Mini/Maxi Batten Panels, Pop Rivet must attach Pitch Break to each Batten Cap

**MINI / MAXI-BATTEN SLOPE CHANGE**

3:12 Slope Minimum

- Clip
- Moisture Barrier (By others)
- Mini or Maxi-Batten Panel (Field cut and bend)
- Optional Pop Rivet (Mini-Batten Only.)
MINI / MAXI-BATTEN TRANSITION

3:12 Slope
Minimum

Clip

Mini or Maxi-Batten Panel

Moisture Barrier (By others)

Roof Panel (Field-cut pan bend flat)

Batten (Field-cut and fashioned)

Pop Rivet (1 per side)

 Tube Sealant
ARCHITECTURAL PANEL GRAVEL STOP

Ballast
Tape Sealant
Pancake Head Wood screw (1'-0" o.c.)
Tube Sealant
Z-Closure (See page 57)
Pop Rivet (2 per panel and see note below)
Gravel Stop
Architectural Wall Panel

NOTE
For Mini/Maxi Batten Panels, Pop Rivet must attach Gravel Stop to each Batten Cap

SOFFIT GRAVEL STOP

Fastener (By others)
Double Bead Tape Sealant
Gravel Stop
Pop Rivet (1'-0" o.c.)
Cleat
ARCHITECTURAL PANEL OUTSIDE CORNER

- Z-Closure
- Outside Corner
- Architectural Wall Panel
- Double Bead Tape Sealant
- Pancake Head Woodscrew (1'-0" o.c.)
- Double Bead Tape Sealant
- Pop Rivet (1'-0" o.c.)

SOFFIT OUTSIDE CORNER

ARCHITECTURAL PANEL COPING

- Wood screw
- Coping
- Z-Closure (See page 57)
- Pancake Head Wood screw (1'-0" o.c.)
- Tube Sealant
- Double Bead Tape Sealant
- Pop Rivet (See note below)
- Architectural Wall Panel

NOTE
For Mini/Maxi Batten Panels, Pop Rivet must attach Coping to each Batten Cap

SOFFIT BASE

- Soffit Panel
- Moisture Barrier (By others)
- Pancake Head Wood screw (1'-0" o.c.)
- 1.5" Base
SOFFIT JAMB

- Soffit Panel
- Pancake Head Wood screw (1'-0" o.c.)
- Pop Rivet (1'-0" o.c.)
- Soffit Panel Jamb
- Moisture Barrier (By others)

SOFFIT TO WALL

- Pancake Head Wood screw (1'-0" o.c.)
- Soffit Panel
- Soffit Panel Miter Trim
- Pop Rivet (1'-0" o.c.)
**MINI / MAXI-BATTEN PANEL SPLICE**

3:12 Slope
Minimum

- Clip
- Mini or Maxi-Batten Panel
- Pop Rivet (Fasten down-slope Batten to Panel)
- Pancake Head Woodscrew (4 per panel)
- Double Bead Tape Sealant
- Offset Cleat (Field cut to fit between ribs)
- Tube Sealant
- Moisture Barrier (By others)
- Batten Cap (Field notch to fit up-slope Batten)
- Clip

**SOFFIT SPLICE CORNER**

- Soffit Panel
- Pop Rivet (1'-0" o.c.)
- Soffit Panel Miter Trim

**REFLECTED SOFFIT PANEL**
Field notch rib

Field bend flat part of panel to accept Offset Cleat.

Hemming Tool

Field apply sealant in bend and insert Offset Cleat.

Up to 1 1/2"

Up to 1 1/2"
Field notch rib

Up to 1 1/2"

Field bend flat part of panel to accept Offset Cleat.

Hemming Tool

Field-apply sealant in bend and insert Offset Cleat.
**INSTALLATION NOTES**

1. Place a row of Double Bead Tape Sealant across panel and over each rib approximately 4" from panel end. Before proceeding, make sure Z-Closure placement will accommodate flashing.
2. Field cut the Z-Closure 2" longer than the panel width. Snip the top and bottom leg of the Z-Closure and bend both sides back (as shown above).
3. Fasten through the Z-Closure, Tape Sealant, Magna-Loc panel and substrate with appropriate fasteners.
4. Apply a row of Double Bead Tape Sealant across the top of the Z-Closure filling any gaps or openings around the panel ribs. This will be fastened through when the flashing is installed.
Though factory applied prepainted finishes are very durable and will last many years, eventually it may be desirable to thoroughly clean or repaint them.

Dirt pickup may cause apparent discoloration of the paint when it has been exposed in some dirt laden atmospheres for long periods of time. In areas of strong sunlight, slight chalking may cause some change in appearance. A good cleaning will often restore the appearance of these buildings and render repainting unnecessary. An occasional light cleaning will help maintain a good appearance.

In many cases, simply washing the building with plain water using a hose or pressure sprayer will be adequate. In areas where heavy dirt deposits dull the surface, a cloth or soft bristle brush and solution of water and detergent (1/3 cup of laundry detergent per gallon of water for example) may be used. This should be followed by an adequate rinse of water. Do not use wire brushes, abrasives, or cleaning tools which will damage the coating surface.

Mildew may occur in areas subject to high humidity but is not normally a problem due to the high inherent mildew resistance of the baked finish that is used. However, mildew can grow on dirt and spore deposits in some cases. To remove mildew along with the dirt, the following solution is recommended.

- 1/3 cup detergent (Tide® or equivalent)
- 2/3 cup trisodium phosphate (Solex® or equivalent)
- 1 quart of 5% sodium hypochlorite solution (Clorox® or equivalent)
- 3 quarts of water

Strong solvents and abrasive type cleaners should be avoided. Most organic solvents are flammable and toxic, and must be handled accordingly. When using a solvent, consult maintenance professionals and label instructions for proper handling and disposal of washings. If required, a mild solvent such as mineral spirits can be used to remove caulking compounds, oil, grease, tars, wax, and similar substances. Use a cloth dampened with mineral spirits and apply only to areas which are contaminated. Follow up the use of this mild solvent with detergent cleaning and rinsing.
